

Italtherm presents Time, the boiler that cuts down consumptions and increases efficiency.

The new **Time can reduce energy consumptions and unhealthy emissions** thanks to the **Acqua Step** system and to its innovative **Mixer**.

Mixer is the new component that allows a power modulation up to a **ratio of 1 to 10**, avoiding frequent blowing outs and ignitions of the burner.

Time has been launched on the market to meet the more and more pressing need to cut down gas consumptions and pollution caused by the use of fossil fuels for the heating.

This is possible thanks to the Acqua Step system, able to pre-heat water only in the exchanger with the smallest needed quantity of gas, and, above all, thanks to the innovative combustion group with the Mixer. This new component, optimized by Italtherm R & D, allows a wide field of power modulation up to a ratio of 1 to 10 and makes our boiler perfect for nowadays modern and exigent heating systems. Besides, the Mixer avoids frequent blowing outs and ignitions of the burner, assuring an optimal management of energy resources.

Time is perfectly integrable with the Easy Solar System, for which Italtherm is the exclusive distributor in Italy. Easy Solar is the only solar thermal system **fed by a photovoltaic** panel that grants its functioning with no need of electrical energy and, consequently, with zero emissions.
