

Italtherm is launching innovative and environmentally friendly products

We present the new catalogue, with important innovations in the field of environmentally friendly heating.

Italtherm continues its growth, giving great space to innovative and environmentally friendly products.

After one year only of activity and, after having obtained the ISO 9001 Quality Management System Certification, Italtherm is launching new products highly oriented towards energy savings and renewable energy sources, such as Tecnosolar, *the new solar thermal panel*, Dyno,

*the new line of water heaters and
Time Power
, the new line of gas boilers.*

Tecnosolar is a particular type of solar thermal panel with forced flow, equipped with an anti-stagnation kit, able to cool down the panel when the temperature is too high, protecting it from the damages that may occur especially in periods of torrid weather.

On the other hand, Time Power boilers have a very wide modulation range, allowing bigger savings in terms of energy consumptions and lower damaging emissions.

Pietro Giannotta, the Commercial Director of Italtherm, says: *"We made a promise: our aim is to create efficient and reliable products, caring about environment and energy savings. Our challenge is above all a challenge with ourselves: we believe that the real change starts from our approach to work and that it is necessary to offer not only the greatest quality but also the biggest possible savings...and the new products are a tangible proof of our commitment"*

Italtherm is a young company, but its staff has more than thirty years of experience in the domestic heating field. With a strong Made in Italy vocation, Italtherm works for innovation and renewable energy sources.
